

Slide 1 — Title

"Hey everyone, I'm Sania, and today I want to walk you through something I've been building called Software Teams. It's an AI-powered task management app, designed specifically for development teams. I'll walk you through the problem I'm solving, how the app works, how it stacks up against tools you've probably already used, and where I'm taking it next."

Slide 2 — Agenda

"Here's the roadmap for this video. I'll start with the actual problem I'm trying to solve. Then I'll show you my proposed solution and how it's structured. After that, I'll walk through a detailed comparison against three major players in this space — Trello, Asana, and Jira — including real pros and cons for each. Then I'll get into the actual features that make Software Teams different, the technology I'm building it with, how I'm approaching development using Agile, and finally, how this could work as a real, sustainable product."

Slide 3 — Problem Statement

"Let's talk about the actual problem. If you've ever used Jira or Asana on a small team, you know the feeling — these tools are built for huge organizations, with sprints, epics, story points, dozens of settings, most of which a five-person team is never going to touch. That's feature overload. On top of that, there's no real system for tracking who's overloaded and who isn't — tasks just get handed out based on guesswork, or whoever happens to be in the room. And then there's onboarding — every time a new teammate joins, they need actual training just to use the tool that's supposed to make their life easier. So the real question I asked myself was: how do you build one lightweight app that keeps a small team's workload visibly balanced, without dragging in all that bloat?"

Slide 4 — Proposed Solution

"My answer to that is Software Teams — one board, two roles, nothing extra to learn. A Manager creates tasks, assigns them, or accepts a suggestion from the AI, and can see the full board along with a workload view. A Team Member just sees their own tasks, moves them across the board, and leaves comments — that's it, no training required. And technically, it's built with React Native and Expo Router, which means the exact same codebase runs as an iOS app, an Android app, and a full website. One build, three platforms."

Slide 5 — Market Comparison

"Now here's where it gets interesting. I actually sat down and compared Software Teams against the three biggest names in this space — Trello, Asana, and Jira — across seven features that I think actually matter for a small team. And Software Teams is the only one that checks every single box. The one I'm most proud of is the last row

— AI that shows you *why* it made a suggestion, instead of just handing you an answer with no explanation. None of the other three do that."

Slide 6 — Trello

"Let's start with Trello. It's got ten million-plus downloads on Google Play, and it's genuinely one of the easiest tools to pick up — the free plan works well, and it's the cheapest paid option of the three. But it has basically no workload management, its AI features are very light and locked behind paid plans, and honestly, it starts to fall apart once your projects get bigger than a simple checklist."

Slide 7 — Trello Reviews

"Here's a look at some real user reviews for Trello, so you can see what actual users are saying — the praise lines up with what I just mentioned, people love how simple it is, but you'll also see complaints about it not scaling well for anything more complex."

Slide 8 — Asana

"Next up is Asana — five million-plus downloads, and it's a lot more powerful than Trello. You get multiple views — list, board, timeline — a built-in workload view, and their AI Studio can actually suggest task owners based on capacity, which is close to what I'm building. But it takes more time to learn and set up, the best AI features need paid plans and credits, and the free plan caps out at just two users, which rules it out for most small teams right away."

Slide 9 — Asana Reviews

"And here are some real reviews on Asana. You'll notice a pattern — people appreciate the power, but a lot of reviews mention the learning curve and the cost once you actually want the good features."

Slide 10 — Jira

"Then there's Jira — one million-plus downloads, and the highest rating of the three at four-point-four stars. It's genuinely the best tool out there for sprint planning and backlog management, and it's got thousands of add-ons in its marketplace. But it's complex, it needs real training to use properly, its mobile app gets called limited by users constantly, and workload tracking isn't even built in — you need to install add-ons just to get that."

Slide 11 — Jira Reviews

"Here's what real users are saying about Jira. Again, same story — powerful, but complicated, and that complexity is exactly what I wanted to avoid building."

Slide 12 — Workflow Features

"So here's what Software Teams actually does. Four core features. First, a Kanban board with a live workload chart built right in — no add-ons needed. Second, AI Smart Auto-Assign — when a new task comes in, it suggests who should take it and tells you

exactly why, like 'Sarah has two open tasks, Jake has six.' Third, an AI Task Writer — you type a rough one-liner, and it turns that into a clear title, a description, and a checklist. And fourth, an AI Weekly Summary — one click, and it writes a plain-English recap of what got done and what's stuck, so nobody has to write a status report by hand."

Slide 13 — Technologies Used

"On the technical side, I'm using React Native and Expo so I get one codebase across every platform. TypeScript to catch bugs early, and Expo Router to handle navigation. Firebase Auth handles login, Cloud Firestore stores all the data and enforces who can see what through security rules, and Cloud Functions is what actually runs the AI calls safely on the server, so nothing sensitive ever touches the client directly. And GitHub Actions runs automated tests before anything gets released."

Slide 14 — Agile Methodology

"I'm building this the Agile way — short, repeatable cycles. Plan, build, test, demo what shipped, reflect on what to improve, and go straight into the next cycle. It keeps the scope tight and makes sure I always have something working to show, not just a pile of half-finished code."

Slide 15 — Two Sprints, Four Weeks

"Specifically, I've broken this into two sprints over four weeks. Sprint one is the core board — login, the two roles, creating and viewing tasks, and moving them across the board. Sprint two is where the AI features come in — auto-assign, the task writer, the weekly summary, plus the workload chart, notifications, and final polish before the demo."

Slide 16 — Research & References

"Everything I've shown you is backed by real sources — not guesses. The download and rating numbers came straight from the Google Play Store. The feature comparisons came from 2026 industry reports. And the architecture decisions are backed by Expo and Firebase's own documentation. I wanted this to be grounded in actual data, not just my opinion."

Slide 17 — Thank You

"That's Software Teams. I'm actively building this right now, and I'm putting this on GitHub repo, so if you want to follow along, the link is right below. Thank you so much for watching, and I'd genuinely love to hear your feedback, especially if you've felt the same frustration with the tools out there right now."
